

Name: Rania Maaraba

Ask for user input based on the year and the quarter
Save those values

Use the user values to then calculate the GDP using the four
statements:

$\text{epochq} = 1977 * 4$

$\text{cd} = \text{uy} * 4 + (\text{uq} - 1)$

$\text{qb} = \text{cd} - \text{epochq}$

Replace uy and uq for the user data and calculate

Print the final statements outputting the year, quarter, and total GDP
